

# Tree Queries

Time Limit: 1 second

Given an undirected, unweighted tree of  $N$  vertices rooted at  $1$ , you have to answer  $Q$  queries. Each query is of the type :  $\mathbf{v} \mathbf{d}$ . Count the number of vertices in the subtree of  $\mathbf{v}$  which are at a distance of  $\mathbf{d}$  from  $\mathbf{v}$ . Note that distance between nodes  $\mathbf{u}$  and  $\mathbf{v}$  is defined as the number of edges on the path from  $\mathbf{u}$  to  $\mathbf{v}$ .

## Input

---

The first line contains  $N$  &  $Q$  denoting the number of vertices and queries.

Next  $N - 1$  lines contain  $\mathbf{u_i} \mathbf{v_i}$  denoting  $i^{\text{th}}$  undirected edge.

Next  $Q$  lines contain the query :  $\mathbf{v} \mathbf{d}$  denoting the vertex and the distance.

---

## Output

---

$Q$  lines each containing the answer to the query i.e. the number of vertices  $\mathbf{u}$  in the subtree of  $\mathbf{v}$  such that  $\text{dist}(\mathbf{u}, \mathbf{v}) = \mathbf{d}$ .

---

## Constraints

---

- $1 \leq N \leq 10^5$
  - $1 \leq Q \leq 2 \times 10^5$
  - $1 \leq u_i, v_i \leq N$
  - $0 \leq d \leq 10^9$
